

Deployment of Flask app

Deploy means?

To deploy a project means to make it visible for other people on the internet.

Where to Deploy?

- There are many providers out there that offers servers for Flask projects.
- We will use the **render** platform
- **Why?** because they offer a free solution that only requires you to create an render account.

Create Requirements

- When you create a Flask application, there are some Python packages that your project depends on.
- Flask itself is a Python package, and we have to make sure that the server where we deploy our project also has the Flask package installed, and all the other packages your project requires.
- Run this command in the command view:
conda activate myflask
pip freeze > requirements.txt

Check that requirements.txt is created with below packages

```
≡ requirements.txt ✕  
≡ requirements.txt  
1 blinker==1.8.2  
2 click==8.1.7  
3 colorama==0.4.6  
4 Flask==3.0.3  
5 importlib_metadata==8.5.0  
6 itsdangerous==2.2.0  
7 Jinja2==3.1.4  
8 MarkupSafe==3.0.1  
9 Werkzeug==3.0.4  
10 zipp==3.20.2  
11 gunicorn==20.0.4
```

Create Aptfile

Create Procfile

Create runtime.txt

First, Check your python version:

python --version

Create Github account

- Go to <https://github.com/>
- Signup
- Verify your email address
- sign in

Click New to create New repository

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere?

[Import a repository.](#)

Required fields are marked with an asterisk ().*

Owner *

Repository name *

/ LibraryWebApp

✔ LibraryWebApp is available.

Great repository names are short and memorable. Need inspiration? How about [symmetrical-octo-spoon](#) ?

Description (optional)

Public

Anyone on the internet can see this repository. You choose who can commit.

Private

You choose who can see and commit to this repository.

Set up GitHub Copilot

Use GitHub's AI pair programmer to autocomplete suggestions as you code.

Get started with GitHub Copilot

Add collaborators to this repository

Search for people using their GitHub username or email address.

Invite collaborators

Quick setup — if you've done this kind of thing before

Set up in Desktop

or

HTTPS

SSH

<https://github.com/siyasardesai/LibraryWebApp.git>

Get started by [creating a new file](#) or [uploading an existing file](#). We recommend every repository include a [README](#), [LICENSE](#), and [.gitignore](#).

...or create a new repository on the command line

```
echo "# LibraryWebApp" >> README.md
git init
git add README.md
git commit -m "first commit"
git branch -M main
git remote add origin https://github.com/siyasardesai/LibraryWebApp.git
git push -u origin main
```

- Click on uploading existing file
- Drag & drop all files from Library Management System folder & commit the changes
